## FUNCTION

Amplifiers are used for the isolation or conversion of analog signals. This guarantees a safe decoupling between the sensor and evaluation circuit and any influence of other sensor circuit among each other is absolutely impossible. Input and output of the ST1.00SDC are equipped with a current- or voltage range.

The range selection is being made by DIL-switch S1 and $S 2$ on the side, the desired adjustment can be chosen from the table on the side. The integrated Live-Zero Monitor is also able to control the input current ranges on error.

Connection diagram:

## Mounting details:

Housing for top hat rail
Type of protection: IP 20
Mounting rail fixed according to EN 50022-35 x 6,2 mm
Width: $\quad 6,2 \mathrm{~mm}$
Weight: $\quad 52 \mathrm{~g}$
Material: Polyamide PA
Flammability class: V0 (UL 94)
Approval: CE
Connection: screw clamps
0,14...2,5 mm²

For safety reasons we recommend to mount the housing for top hat rail with a distance $>1 \mathrm{~mm}$ to each other. Please check switch setting before initial operation!

## FUNCTION

Amplifiers are used for the galvanic isolation or conversion of analog signals. This guarantees a safe decoupling between sensor and evaluation circuit and any influence of other sensor circuits among each other is absolutely impossible. The STP 1.00 SDC is equipped with bipolar current and voltage inputs as well as current and voltage outputs.

It can be adjusted and parameterized easily by the USB2 adapter in connection with KALIB-Software. Indication of status is signalized by front sided LED. The integrated protective switching with suppressor diode protects the secondary circuit from voltage peaks and transient excess voltage.

## STP 1.00 SDC

Connection diagram:

[^0]| Input: |  |  |
| :---: | :---: | :---: |
| I: DC current (bipolar): connection: | $\begin{aligned} & -20 \ldots 0 \ldots+20 \mathrm{~mA} \\ & -10 \ldots 0 \ldots+10 \mathrm{~mA} \\ & \text { terminal } 8-, 7+ \\ & \hline \end{aligned}$ | input resistance approx. $10 \Omega$ |
| U: DC voltage (bipolar): connection: | $\begin{aligned} & -20 \ldots 0 \ldots+40 \mathrm{~V} \\ & -20 \ldots 0 \ldots+20 \mathrm{~V} \\ & -10 \ldots 0 \ldots+10 \mathrm{~V} \\ & -5 \ldots 0 \ldots+5 \mathrm{~V} \\ & \text { terminal } 8-, 6+ \end{aligned}$ | input resistance approx. $250 \mathrm{k} \Omega$ |
| U: DC voltage (bipolar): connection: | $\begin{aligned} & -250 \ldots 0 \ldots+250 \mathrm{mV} \\ & -500 \ldots 0 \ldots+500 \mathrm{mV} \\ & -500 \ldots 0 \ldots+1000 \mathrm{mV} \\ & -500 \ldots \ldots+2000 \mathrm{mV} \\ & \text { terminal } 8-, 5+ \end{aligned}$ | input resistance approx. $1 \mathrm{M} \Omega$ |
| Within the described measuring ranges the beginning respectively the end can be freely selected. |  |  |
| Output: |  |  |
| I: Ioad-independent DC current: connection: | 0(4)... 20 mA terminal $3-, 4+$ | permissible load max. $580 \Omega$ |
| U: load-independent DC voltage: connection: | $\begin{aligned} & 0(2) \ldots 10 \mathrm{~V} \\ & \text { terminal } 3-, 4+ \end{aligned}$ | permissible load $\geq 1 \mathrm{k} \Omega$ |

The minimum/ maximum limits for current and voltage output are freely selectable and adjustable in clear text. On exceeding or falling below the error limits at the input, a defined fixed value can be predetermined in case of error for the output.

## Adjustment:

Measuring ranges and parameterization are adjustable in parameter data by KALIB-Software. You need a PC and the interface adapter USB2 with KALIB-Software.

## FEATURES

■ Switchable inputs: Current 0(4)... 20 mA or
Voltage 0(2)... 10 V

- Outputs simultaneous: Voltage $0(2) . . .10 \mathrm{~V}$ and Current 0(4)... 20 mA active or loop-powered

■ Function, switchable:

- fixed calibration or
- adjustable by trimmer or
- simulation mode for outputs

■ Galvanic 3-way isolation of $2,5 \mathrm{kV}$
Low internal consumption

## FUNCTION

Amplifiers are used for the galvanic isolation or conversion of analog signals. This guarantees a safe decoupling between sensor and evaluation circuit and any influence of other sensor circuit among each other is absolutely impossible. This Amplifier is equipped with standard current and voltage inputs as well as current and voltage outputs.

The TF 19.00 GW can be switched to different characteristics of transmission by front side turnswitch. Fixed calibrated measuring ranges for input and output are stored in switch setting $0 . . .7$. In position 8...D the transmission ranges can be adjusted by zero point and range trimmer. Position E and F are used for simulation during initial operation, here a fixed output value can be generated by zero point and range trimmer, without input signal.

## Connection diagram:

[^2]Input:

| I: DC current: connection: | 0(4)... 20 mA terminal $4-, 5+$ | input resistance approx. $10 \Omega$ |
| :---: | :---: | :---: |

- fixed calibration or
- adjustable by trimmer or
- simulation mode for outputs
- Galvanic 3-way isolation of $2,5 \mathrm{kV}$

## FUNCTION

The TF 19.00 GW 148 does the peak value measurement: $f=6 \mathrm{~Hz}$ (half sinus).
Amplifiers are used for the galvanic isolation or conversion of analog signals. This guarantees a safe decoupling between sensor and evaluation circuit and any influence of other sensor circuit among each other is absolutely impossible. This Amplifier is equipped with standard current and voltage inputs as well as current and voltage outputs.

The TF 19.00 GW 148 can be switched to different characteristics of transmission by front side turnswitch. Fixed calibrated measuring ranges for input and output are stored in switch setting $0 . . .7$. In position 8...D the transmission ranges can be adjusted by zero point and range trimmer. Position E and F are used for simulation during initial operation, here a fixed output value can be generated by zero point and range trimmer, without input signal.

## TF 19.00 GW 148

Connection diagram:

[^3]| Input: |  |  |
| :---: | :---: | :---: |
| I: DC current: connection: | 0(4)... 20 mA terminal 4-, $5+$ | input resistance approx. $10 \Omega$ |
| U: DC voltage: connection: | $\begin{aligned} & 0(2) . . .10 \mathrm{~V} \\ & \text { terminal } 4-, 6+ \end{aligned}$ | input resistance approx. $500 \mathrm{k} \Omega$ |
| Output: |  |  |
| I: Ioad-independent DC current: connection: or: | $0(4) \ldots 20 \mathrm{~mA}$ terminal 10 -, $11+$ | permissible load max. $500 \Omega$ |
| loop-powered DC current: connection: | $0(4) . . .20 \mathrm{~mA}$ terminal $9-, 12+$ | max. permissible voltage 30 V |
| U: load-independent DC voltage: connection: | 0 (2)... 10 V terminal $7-, 8+$ | permissible load $\geq 2 \mathrm{k} \Omega$ |

The maximum limits for current- and voltage output are fixed at 22 mA respectively 11 V .

## Adjustment:

The characteristics of transmission are adjustable by front side turn-switch.

## Environmental conditions:

Storage temperature: $\quad-40 \ldots+70^{\circ} \mathrm{C}$
Operating temperature: $\quad 0 . . .55^{\circ} \mathrm{C}$
Isolation voltage:
2,5 kV eff. 1 sec. input-output $2,5 \mathrm{kV}$ eff. 1 sec . auxiliary voltage

*minimum deviations possible during HF-radiation influence

## Mounting details:

Housing for top hat rail
Type of protection: IP 20 housing IP 20 clamps
Rail-mounting fixed according to
EN 50022-35 x 7, 5 mm
Width: $\quad 22,5 \mathrm{~mm}$
Weight: $\quad 140 \mathrm{~g}$
Material: Polyamide PA
Flammability class: Vo (UL94)
Approval: CE
Connection: screw clamps
$\leq 2,5 \mathrm{~mm}^{2}$

Please check switch position before initial operation!

Ordering information:
Type: TF 19.00 GW 148

## FEATURES

■ Input, switchable:
Current 0(4)... $20 \mathrm{~mA}, \pm 10 \mathrm{~mA}$ or
Voltage 0(2)... $10 \mathrm{~V}, \pm 10 \mathrm{~V}$

- Output, simultaneous: Current 0(4)... 20 mA and
Voltage 0(2)... 10 V
- Fine adjustment of offset and gain by trimmer
Galvanic 3-way isolation of 4 kV

The desired input range can be chosen from the table on the side, the adjustment is carried out by front sited turn switch. The output ranges are switchable. The integrated protective switching with suppressor diode protects the secondary circuit from peaks and transient excess voltage.

## FUNCTION

Isolating amplifiers are mainly used for the galvanic isolation or conversion of analog signals. This guarantees a safe decoupling between sensor and evaluation circuit and any influence of sensor circuits among each other is absolutely impossible. The UT 19.00 GW has one input for current or voltage and one output which can do current and voltage simultaneous. Fine adjustment of offset and gain is being made by trimmer.

## UT 19.00 GW

Connection diagram:

## Mounting details:

Housing for top hat rail
Type of protection: IP 40 housing
IP 20 clamps
Rail-mounting fixed according to
EN 50022-35×7.5 mm
Width: $\quad 22,5 \mathrm{~mm}$
Weight: $\quad 160 \mathrm{~g}$
Material: Polyamide PA
Flammability class: Vo (UL94)
Approval: CE
Connection: pluggable
screw clamps
$0,2 \ldots 2,5 \mathrm{~mm}^{2}$
For safety reasons we recommend to mount the housing for top hat rail with a distance of approx. 5 mm to each other.
Please check DIP-switch before initial operation!

Ordering information:
Type: TT 2.00 GW
wide range

## FEATURES

## ■ Inputs:

$2 x$ voltage
E1: 0... $60 \mathrm{mV} / \mathrm{E2:} \mathrm{0..}$.

- Outputs simultaneous: $2 x$ current 0(4)... 20 mA and
$2 x$ voltage 0(2)... 10 V
- Function, switchable:
- fixed calibration or
- adjustable by trimmer
- Pluggable screw-clamps

■ Galvanic 3-way isolation per channel

## FUNCTION

The 2-channel TT 2.00 GW 315 is used for the precise potential isolation of two different measuring signals. Channel 1 processes signals from $0 . . .60 \mathrm{mV}$, channel 2 from $0 . . .200 \mathrm{~V}$. The unit has 4 DIP-switches on frontside.
DIP-switch 1 must be ON, DIP-switch 2 must be OFF. DIP-switch 3 determines the output signal.
Fixed calibrated standard measurement ranges, for input and output, are stored in the device: 0(4)... 20 $\mathrm{mA} / 0(2) \ldots 10 \mathrm{~V}=$ DIP-switch 40 FF.
Each output channel can alternatively be adjusted separately and the individual range can be set.
The fine adjustment of the offset and the final value is carried out by trimmer $=$ DIP-switch 40 N .

The galvanic 3-way isolation is used to protect against faulty measurement or damage downstream equipment such as analog control units, control rooms, control systems, PLC units.
The integrated protection circuit with suppressor diode protects the secondary circuit from voltage spikes and transient surges.

wide range

## FEATURES

- 1 input:

Current 0(4)... 20 mA or
Voltage 0(2)... 10 V

- 2 outputs:

Current 0(4)... 20 mA/
Voltage 0(2)... 10 V

- Parameterization without auxiliary power via PC-interface

■ Galvanic 4-way isolation of 1 kV

Low internal consumption

## FUNCTION

The AV 2.00 SDC is used for duplicating an input signal to 2 galvanically isolated individual output signals. This guarantees a safe decoupling between sensor and evaluation circuit and any influence of other sensor circuits among each other is absolutely impossible.

He is able to process currents respectively voltages within a range of $0 . . .20 \mathrm{~mA}$ or $0 \ldots 10 \mathrm{~V}$. The input is being defined by range start and range end, signal damping as well as fixed limits of error detection can be freely selected. The 2 outputs are separately and individually adjustable for current or voltage output. For each output the range start and range end, minimum/ maximum limits and a fixed value in case of error detection can be adjusted in clear text.

## AV 2.00 SDC

Connection diagram:

[^8]| Input: |  |  |
| :---: | :---: | :---: |
| I: DC current: connection: | $\begin{aligned} & 0(4) \ldots 20 \mathrm{~mA} \\ & \text { terminal } 3-, 4+ \end{aligned}$ | input resistance approx. $10 \Omega$ |
| U: DC voltage: connection: | $\begin{aligned} & 0(2) . .10 \mathrm{~V} \\ & \text { terminal } 4-, 3+ \end{aligned}$ | input resistance approx. $50 \mathrm{k} \Omega$ |

Within the described measuring ranges the range start, range end, signal damping as well as the limits for a detection of error can be freely selected.

## Output:

| I: load-independent DC current: connection output 1: connection output 2: | 0(4)... 20 mA <br> terminal $8-, 7+$ <br> terminal $6-, 5+$ | permissible load max. $400 \Omega$ |
| :---: | :---: | :---: |
| U: load-independent DC voltage: connection output 1: connection output 2: | $\begin{aligned} & 0(2) \ldots 10 \mathrm{~V} \\ & \text { terminal } 8-, 7+ \\ & \text { terminal } 6-, 5+ \end{aligned}$ | permissible load $\geq 2 \mathrm{k} \Omega$ |

The 2 outputs are adjustable independently of each other for current or voltage source.
For each output channel the output range start and output range end, the minimum/ maximum limits for current and voltage output as well as a fixed predetermined value in case of error detection can be adjusted in clear text.

## Adjustment:

Measuring ranges and parameterization are adjustable in parameter data by KALIB-Software.
You need a PC and the interface adapter USB2 with KALIB-Software.
Preset parameterization (change possible):
Input:
$0 . . .20 \mathrm{~mA}$
Output 1/ 2:
0... 20 mA

■ Galvanic 3-way isolation per channel

## FUNCTION

The TTV 2.00 GW transfers the input signal to 2 galvanically isolated output channels. The unit has 4 DIP-switches on frontside.
To select the transmission or the signal conversion ranges, use the DIP-switches 1-3.
Fixed calibrated standard measurement ranges, for input and output, are stored in the device: 0(4)... 20 $\mathrm{mA} / 0(2) \ldots 10 \mathrm{~V}=$ DIP-switch 4 OFF.
Each output channel can alternatively be adjusted separately and the individual range can be set. The fine adjustment of the offset and the final value is carried out by trimmer $=$ DIP-switch 4 ON.

The galvanic 3-way isolation is used to protect against faulty measurement or damage downstream equipment such as analog control units, control rooms, control systems, PLC units. The integrated protection circuit with suppressor diode protects the secondary circuit from voltage spikes and transient surges.

## FEATURES

## ■ Input:

Current 0(4)... 20 mA
$1 x$ at MP 1.10 S
$2 x$ at MP 2.10 S
■ Output:
Current 0(4)... 20 mA
$1 x$ at MP 1.10 S
2x at MP 2.10 S
■ No auxiliary power required

- Galvanic 2-way isolation of 500 V

## FUNCTION

The MP 1.10 S is used for the galvanic isolation of direct current circuits. The ratio of transmission input to output is 1:1. The transducer has only a low power consumption; this capacity is removed from the measuring signal. As far as load is concerned you have to consider that the internal resistance of the transmitter must be added to the input resistance of the final device and is not supposed to exceed the total load of the measuring transducer.

Disturbances by coupling of different signal circuits as well as earth or mass potential differences can easily be avoided or eliminated afterwards by the MP .10 S . The integrated protective switching with suppressor diode ( 33 V ) protects the secondary circuit from voltage peaks and transient excess voltage. Attention: with output open the primary loop is interrupted.

## MP 1.10 S MP 2.10 S

## Connection diagram:

## FEATURES

■ Input, switchable: Current $\pm 20 \mathrm{~mA}$ or
Voltage $\pm 10 \mathrm{~V}, 60 \mathrm{mV}$ to 100 V
■ Output, simultaneous: Current $\pm 20 \mathrm{~mA}$ and Voltage $\pm 10 \mathrm{~V}$

- Integrated transmitter feeding

■ Linearity tolerance $<0,1$ \% frequency range $0 . . .1$ kHz

- Parameterization via PC-interface
- Galvanic 3-way isolation of 4 kV

## FUNCTION

Accurate calibration and high-precision potential isolation: the STV 2.00 GW is a universal Bipolar Feeding Isolating Amplifier with calibrated, switchable measuring ranges for the different analog measuring signals for conversion and galvanic isolation. It has a bipolar input for current or voltage and one bipolar output which can do current and voltage simultaneous.
A LED on front side indicates if the input is within or outside the range.
The different characteristics of transmission can be selected by turn-switch. Fixed calibrated measuring ranges for input and output are stored in position 0...E. See table on side.

At position F the transmission ranges can be individually defined with the USB2-Adapter in connection with KALIB-Software:
Input: absorbability $0,4 \mathrm{~ms} . . .50 \mathrm{sec} .$, range, zero point, final value.
Output: range, zero point, final value, output minimum, output maximum.
With its frequency range of $0 \ldots 1 \mathrm{kHz}$ the STV 2.00 GW is ideal for very fast applications and can be used for e.g. measuring of water hardness, recording of rotation direction and speed, 2- and 3 -wire transmitter feeding.

## FUNCTION

The TTS 1.00 MW is used for the precise potential isolation of different measuring signals. The unit has 4 DIP-switches on frontside.
To select the transmission or the signal conversion ranges, use the DIP-switches 1-3.
Fixed calibrated standard measurement ranges, for input and output, are stored in the device: $0(4) \ldots 20 \mathrm{~mA} / 0(2) \ldots 10 \mathrm{~V}=$ DIP-switch 40 OFF.
The fine adjustment of the offset and the final value is carried out by trimmer $=$ DIP-switch 40 N .

Its output can do current (active or passive) and voltage simultaneous.
Because of the integrated transmitter feeding, 2-/ 3-wire transmitters will be fed.
The galvanic 3-way isolation is used to protect against faulty measurement or damage downstream equipment such as analog control units, control rooms, control systems, PLC units.
The integrated protection circuit with suppressor diode protects the secondary circuit from voltage spikes and transient surges.

## FEATURES

■ Input, switchable:
Current 0(4)... $20 \mathrm{~mA}, \pm 10 \mathrm{~mA}$ or
Voltage 0(2)... $10 \mathrm{~V}, \pm 10 \mathrm{~V}$

- Output, simultaneous: Current 0(4)... 20 mA and
Voltage 0(2)... 10 V
- Integrated transmitter feeding

■ Fine adjustment of offset and gain by trimmer

- Galvanic 3-way isolation of 4 kV

## FUNCTION

Isolating amplifiers are mainly used for the galvanic isolation or conversion of analog signals. The UTS 19.00 GW is used for the connection of 2 - and 3 -wire transmitters. This guarantees a safe decoupling between sensor and evaluation circuit and any influence of sensor circuits among each other is absolutely impossible. It has one input for current or voltage and one output which can do current and voltage simultaneous. Fine adjustment of offset and gain is being made by trimmer.

The desired input range can be chosen from the table on the side, the adjustment is carried out by turn switch. The output ranges are switchable. The integrated protective switching with suppressor diode protects the secondary circuit from peaks and transient excess voltage.

## Mounting details:

Housing for top hat rail
Type of protection: IP 20
Mounting rail fixed according to

## Ordering information:

Type: MTS 1.20 SDC $24 \mathrm{~V} D C$ transmitter feeding

## FEATURES

■ 1 Input:
Current 0(4)... 20 mA or
Voltage 0(2)... 10 V

- Outputs simultaneous: $2 x$ current 0(4)... 20 mA and
$2 x$ voltage 0(2)... 10 V
- Integrated transmitter feeding

■ Function, switchable: - fixed calibration or - adjustable by trimmer

■ Pluggable screw-clamps
■ Galvanic 3-way isolation per channel

## FUNCTION

The TTSV 2.00 GW transfers the input signal to 2 galvanically isolated output channels. The unit has 4 DIP-switches on frontside.
To select the transmission or the signal conversion ranges, use the DIP-switches 1-3.
Fixed calibrated standard measurement ranges, for input and output, are stored in the device: 0(4)... 20 $\mathrm{mA} / 0(2) \ldots 10 \mathrm{~V}=$ DIP-switch 40 FF.
Each output channel can alternatively be adjusted separately and the individual range can be set. The fine adjustment of the offset and the final value is carried out by trimmer $=$ DIP-switch 4 ON.

Because of the integrated transmitter feeding, 2-/ 3-wire transmitters will be fed. The galvanic 3-way isolation is used to protect against faulty measurement or damage downstream equipment such as analog control units, control rooms, control systems, PLC units. The integrated protection circuit with suppressor diode protects the secondary circuit from voltage spikes and transient surges.

## FEATURES

■ Input:
Current 0(4)...20mA or
Voltage 0(2)... 10 V

- Output:

2 relays with change over contacts
■ 2-wire transmitter feeding

- Parameterization and setting via push-button or integrated interface
- Actual value indication via display

3-Way galvanic insulation of 4 kV

## FUNCTIONALITY

The digital DGS 1.00 GW is used for limit value monitoring of standardised signals. The parameterization is done by the two front side push-buttons and the 4-digit display or via the integrated interface with the USB2 interface/ USB-Simulator in connection with the KALIB-Software. The parameter files can be stored and easily transferred to other devices. The 4-digit actual value display is freely scalable. In relation to the input, the switch-on and switch-off points (limit values) of the two independent relays

can be freely defined. This automatically results in a hysteresis. Hysteresis, pick-up and drop-out delays and the behaviour of the relays in case of sensor break and alarm limits of the relays can be set separately. The relay states are indicated by LEDs on the front. The DGS 1.00 GW has an additional integrated 2-wire transmitter feeding.

## EXAMPLES

## LIMIT VALUE OPERATION MODE

A current input of $4 \ldots 20 \mathrm{~mA}$ should be scaled to a range of $0 \ldots 100$. The upper limit value is 80 and the lower limit value is 30 . The effects on relay 1 are shown with an example process value.

| DGS settings: |  |
| :---: | :---: |
| in.iph | curr |
| in.til | 20 mA |
| inco | 4 mA |
| dEc.P | ----- |
| Sc.Lo | 0.000 |
| Sc.it, | 100.0 |
| ri.Fc | LI.-- |

## WINDOW OPERATION MODE

A current input of 4... 20 mA should be scaled to a range of $0 \ldots 100$. In window mode the upper limit value is 80 and the lower limit value is 30 . The hysteresis is set to a value of 10 here. The effects on relay 1 are shown with an example process value.

DGS settings:

| in.iph | curr |
| :---: | :---: |
| initil | 20 mA |
| inco | 4 mA |

## EXAMPLES

## ALARMS

A current input of $4 . . .20 \mathrm{~mA}$ should be scaled to a range of $0 \ldots 100$. The device is operated in limit value mode with the limits 60 and 30 . Additionally, alarms are now used. For example, the upper alarm limit is defined at 80 and the lower alarm limit at 15 . In the following examples the possible alarm settings are explained.

DGS settings:

| In.Ph | curr |
| :--- | :--- |
| In.HI | 20 mA |
| In.Lo | 4 mA |
| dEc. $P$ | .--- |
| Sc.Lo | 0.000 |
| Sc.H. | 100.0 |
| ri.Fc | LI.-- |
| ri.on | 60.00 |
| ri.or | 30.00 |
| RL.HI | 80.00 |
| RL.Lo | 15.00 |

Alarm function: on. $\mathbf{B H}$

Single exceeding or dropping below the alarm limits switches relay permanently OFF
Alarm function: or. BH' $^{\prime}$

## TIME DELAY

A current input of $4 . . .20 \mathrm{~mA}$ should be scaled to a range of $0 \ldots 100$. An upper limit value of 80 and a lower limit value of 30 are defined. Additionally a time delay of 2 seconds for switching on and 4 seconds for switching off is set. The effects on relay 1 shall be shown by an example process value.

For safety reasons, it is recommended to mount the housings for top-hat rail with a distance of approx. 5 mm between each other

## Order information:

Type: DGS 1.00 GW wide range
Accessories: USB2 / USB-Simulator with KALIB-Software

## FEATURES

■ Input:
Top value measurement: $f=6 \mathrm{~Hz}$
(half sinus)
Input: 0(4)... 20 mA
■ Output:
2 relays with change over contacts
■ 2-wire transmitter feeding

- Parameterization and setting via push-button or integrated interface
- Actual value indication via display

■ 3-Way galvanic insulation of 4 kV

## FUNCTIONALITY

The digital DGS 1.00 GW 148 is used for the top value measurement: $\mathrm{f}=6 \mathrm{~Hz}$ (half sinus). The parameterization is done by the two front side push-buttons and the 4-digit display or via the integrated interface with the USB2 interface/ USBSimulator in connection with the KALIB-Software. The parameter files can be stored and easily transferred to other devices. The 4-digit actual value display is freely scalable. In relation to the input, the switch-on and switch-off points (limit valu-
es) of the two independent relays can be freely defined. This automatically results in a hysteresis. Hysteresis, pick-up and drop-out delays and the behaviour of the relays in case of sensor break and alarm limits of the relays can be set separately. The relay states are indicated by LEDs on the front. The DGS 1.00 GW 148 has an additional integrated 2-wire transmitter feeding.

2 relays with change over contacts
■ Parameterization, handling and actual value indication by display
■ Integrated transmitter feeding
■ Galvanic 3-way isolation of 4 kV

## FUNCTION

The digital DGW 1.00 TW is used for the limit value control of standard inputs.
The parameterization is carried out by front side push-buttons and indicated by display.
The 4-digit actual value indication ist free scalable. Based on the input, the ON and OFF switchpoints (limits) of the two independent relays can be freely definded. This automatically results in a hysteresis.

The ON-delay and the delay release times of the relays are separately adjustable. The status indication of the relays by LEDs.
It has a 2- and a 3-wire transmitter feeding.
At the current input 4... 20 mA or the optional voltage input of $2 \ldots . .10 \mathrm{~V}$ the Live-Zero monitoring is active. At the same time, each relay out of the valid range of $3,9 \ldots 20,8 \mathrm{~mA}(1,9 \ldots 10,4 \mathrm{~V})$ is falling off.

For safety reasons, it is recommended to mount the housings for top-hat rail with a distance of approx. 5 mm between each other

Type: DGS 2.00 GW wide range Accessories: USB2 / USB-Simulator with KALIB-Software

## FEATURES

- 2 Inputs:

Current 0(4)... 20 mA or
Voltage 0(2)... 10 V

- Output:

2 relays with change over contacts

- Parameterization, handling and actual indication by display

■ Integrated transmitter feeding
■ Galvanic 3-way isolation of 4 kV

## FUNCTION

The digital DGW 2.00 TW is used for the limit value control of standard inputs.
The parameterization is carried out by front side push-buttons and indicated by display.
The 4-digital actual value indication is free scalable. Based on the input, the ON and OFF switchpoints (limits) of the two independent relays can be freely defined. This automatically results in a hysteresis.

The ON-delay and the delay release times of the relays are seperately adjustable. The status indication of the relays by LEDs.
It has a 2-and a 3-wire transmitter feeding.
At the current input $4 . . .20 \mathrm{~mA}$ or the optional voltage input of $2 \ldots 10 \mathrm{~V}$ the Live-Zero monitoring is active. At the same time, each relay out of the valid range of $3,9 . . .20,8 \mathrm{~mA}(1,9 . . .10,4 \mathrm{~V})$ is falling off.

## Details of operation: <br> Details ofoperation.

The displayed position gets changed with the push-button $\uparrow$. Values such as $(0)$ to $(9$, minus $\square$, comma $\square$ and space $\square$ are possible.
Use the push-button to confirm the actual position and go to the next or return to the main menu after changing the last digit. Break-off possible by pushing longer.

Optional door installation:
Push red push-button longer than 2 seconds:
code requested. Enter default code to change parameters, otherwise display only.

## FEATURES

■ Input:
PT 100, PT 500, PT 1000, NI 1000
and KTY

- Output:

2 relays with changeover contacts

- Parameterization and adjustment
by push-button or integrated interface
- Current value indication via display
- 3-Way galvanic isolation of 4 kV

Further - also customer-specific - sensors can be loaded via the KALIB-Software. In relation to the input, the switch-on and switch-off points (limit values) of the two independent relays can be freely defined. This automatically results in a hysteresis. Hysteresis, pick-up and drop-out delays, the behaviour of the relays in case of sensor break and the alarm limits can be set separately. The relay states are indicated by LEDs on the front side.

## EXAMPLES

## LIMIT VALUE OPERATION MODE

A temperature measurement with a PT500 element will be performed in 3-wire operation. The upper limit value is $80^{\circ} \mathrm{C}$ and the lower limit value is $30^{\circ} \mathrm{C}$. The effects on relay 1 are shown with an example process value.

DGS settings:

| SEnS | PLO. 5 |
| :--- | :--- |
| LinE | $3 . L$ In |
| ri.Fc | Li.- |

Upper limit value is below lower limit value:

## WINDOW OPERATION MODE

A temperature measurement with a PT500 element shall be performed in 3-wire operation. The upper limit value is $80^{\circ} \mathrm{C}$ and the lower limit value is $30^{\circ} \mathrm{C}$. The hysteresis is set here to a value of $10^{\circ} \mathrm{C}$. The effects on relay 1 are shown with an example process value

DGS settings:

| SERS | PLO.S |
| :--- | :--- |
| LInE | S.Lin |
| FI.Fc | Li.Z |
| HSSE | 10.00 |

## EXAMPLES

## ALARMS

A temperature measurement with a PT500 element will be performed in 3-wire operation. Thereby the device is operated in limit value mode with the limits $60^{\circ} \mathrm{C}$ and $30^{\circ} \mathrm{C}$. Additionally, alarms are now used. The upper alarm limit is defined at $80^{\circ} \mathrm{C}$ and the lower alarm limit at $15^{\circ} \mathrm{C}$. In the following examples the possible alarm settings are explained.

DGS settings:

| $55_{n} 5$ | Ptob. 5 |
| :---: | :---: |
| Link | 3.1 .10 |
| ri.Fc | Li.-- |
| ri.on | 60.00 |
| ri.or | 30.00 |
| BL.H, | 80.00 |
| RL.Lo | 15.00 |

Single exceeding or dropping below the alarm limits switches relay permanently ON

Single exceeding or dropping below the alarm limits switches relay permanently OFF

## TIME DELAY

A temperature measurement with a PT500 element will be performed in 3-wire operation. Thereby the device is operated in limit value mode with the limits $80^{\circ} \mathrm{C}$ and $30^{\circ} \mathrm{C}$. Additionally a time delay of 2 seconds for switching on and 4 seconds for switching off is set. The effects on relay 1 shall be shown by means of an example process value.

DGS settings:

| SEnS | PCO. 5 |
| :---: | :---: |
| LInE | 3.14 |
| ri.Fc | Li.-- |
| t.on | 2 s |
| L.oFr | 4 s |

## FEATURES <br> ■ Input: <br> PT100 temperature measurement <br> ■ Output: 2x transistor <br> ■ Indication of contact state by LED <br> - Additional functions: <br> Hysteresis, ON/ OFF-delay, window, tendency, inverse function, alarm <br> - Parameterization without auxiliary power via PC-interface <br> ■ Galvanic 3-way isolation of $2,5 \mathrm{kV}$ <br> ■ Low internal consumption

## FUNCTION

The GSP 2.01 SDC is used for measurement of temperature and control. All common PT100 sensors can be connected. The limit switch is being parameterized by the USB2 adapter in connection with KALIBSoftware. For the output 2 potential free transistor switches are available which are equipped with limit values, hysteresis, ON/ OFF-delay, window, alarm, inverse function, tendency and sensor control each.

The temperature to be controlled is converted by the PT100 temperature sensor into a non-linear voltage signal. After internal preparation and linearization the value is compared the internally prepared limit value and then the transistor output will be energized.

## Input:

## FEATURES

■ Input:
2x feeding of electrodes
Current max. 1,5 mA
Voltage max. 10 V AC
■ Output:
2 relay (changer, invertible)

- Function selection via DIP-switch

■ Adjustment of conductivity by trimmer 0,5... $50 \mathrm{k} \Omega$

## - Parameterization without

 auxiliary power via PC-interface: - hysteresis times■ Galvanic 4-way isolation

## FUNCTION

The Electrode Relay ER 2.00 MW is a limit switch that is used for minimum, maximum or level monitoring, the two-point control of tanks, silos and containers with electrically conductive liquids.
Internal an alternating voltage square wave signal is being generated. This signal is compared with the conductivity value adjusted via the front side trimmer and evaluated accordingly.
By using an alternating voltage at the electrodes corrosion of the probe rods and electrolytic decomposition of the medium can be avoided in almost all cases of the application.

Whether the relays should respond when the level rises or falls can be set via DIP-switch S1 and S2. The relay states are signaled by the front LEDs.
Furthermore, DIP-switch S3 can be used to select the switching function „between electrode MIN and MAX" (relay switching together) as well as „separate min. and max. function" (relay switching separately, two independent switching points).
The hysteresis times of the relays can be independently parameterized with the USB2 interface adapter or USB-Simulator in conjunction with the KALIBSoftware and switched over with DIP-switch S4.

## Connection diagram:

Hysteresis, window, ON/ OFF-delay, inverse function
■ Galvanic 3-way isolation of 4 kV

## FUNCTION

The Limit Switch GS 2.00 GW is used for the control of limit values of standardized current or voltage signals.
Due to the 2 relays at the output with one potential free change-over contact each two switching functions can be realized. The switching status of the erected relay will be indicated by LED display.

The switching point can be adjusted by the front side push-button the effective direction of the relay by the slide switch on the side.
The application range is e.g. threshold switch, supervisory relay, pump control of containers, control of final signals of positioning elements etc.

## FUNCTION

The GSP 2.00 SDC is used for the control of limit values of standardized signals. The limit switch is being parameterized by the USB2 adapter in connection with KALIB-Software. For the output 2 potential free transistor switches are available which are equipped with limit values, hysteresis, ON/ OFFdelay, window, alarm, inverse function, tendency and sensor control each. The devices can be applied as threshold switch and supervisory relay to monitor temperature, pressure, dry runtime, motor protection, speed, etc.

The values to be controlled can exist as DC signal or $D C$ voltage signal. After internal preparation the input signal will be compared with the digital adjusted limit value and in case of exceeding or falling off the transistor output will be energized.

## FUNCTION

The GSF 2.00 SDC is used for the control of frequencies. As input signal namur signals are processed with a frequency range up to 10 kHz . As a result rotational speed on min./ max. or accelerations can be specified and given out as switching contact. The limit switch is being parameterized by the USB2 adapter in connection with KALIB-Software. For the output 2 potential free transistor switches are available which are equipped with limit values, hysteresis, ON/OFF-delay, window, alarm, inverse function, tendency and sensor control each.

The process variable to be controlled is supplied by a comparator to the processor as frequency after having passed an input filter. Due to the adjustable gate time the frequency can be recorded accordingly and depending on the set-point the transistor output will be energized.

Input:
Namur EN 50227 or potential free contact:

| maximum voltage: | $\mathrm{U}_{\text {max }}=8 \mathrm{~V}$ |
| :--- | :--- |
| maximum current: | $I_{\max }=8 \mathrm{~mA}$ |

Housing for top hat rail IP 20
Type of protection:
Mounting rail fixed according to

Please check parameterization before initial operation!

## FEATURES

■ Frequency input: square wave signal $24 \mathrm{~V} \mathrm{DC/} 10 \mathrm{kHz}$
■ Output: 2x transistor
■ Indication of contact state by LED

- Additional functions:

Hysteresis, ON/ OFF-delay, window, tendency, inverse function, alarm

- Parameterization without auxiliary power via PC-interface
■ Galvanic 3-way isolation of $2,5 \mathrm{kV}$

■ Low internal consumption

## FUNCTION

The GSF 2.00 SDC 021 is used for the control of frequencies. As input signal square wave signals are processed with a frequency range up to 10 kHz . As a result rotational speed on min./ max. or accelerations can be specified and given out as switching contact. The limit switch is being parameterized by the USB2 adapter in connection with KALIBSoftware. For the output 2 potential free transistor switches are available which are equipped with limit values, hysteresis, ON/OFF-delay, window, alarm, inverse function, tendency and sensor control each.

The process variable to be controlled is supplied by a comparator to the processor as frequency after having passed an input filter. Due to the adjustable gate time the frequency can be recorded accordingly and depending on the set-point the transistor output will be energized.

GSF 2.00 SDC 021

Connection diagram:

## FEATURES

■ Indication of contact state by LED
■ Control of 4... 20 mA current loops

- Response time: at $\mathrm{K} 1<10 \mathrm{msec}$. at K2 ~ 10 sec .
- Parameterization without auxiliary power via PC-interface

■ Galvanic 3-way isolation of $2,5 \mathrm{kV}$

- Low internal consumption

## FUNCTION

The Live-Zero Monitoring Device GSP 2.04 SDC is used for the protection and control of process engineering facilities. Hereby the $4 . . .20 \mathrm{~mA}$ current loop is controlled against overload and wire break. In the range of $3,6 \mathrm{~mA}$ and $22,0 \mathrm{~mA}$ the switch K 1 is closed at applied supply voltage.

In case of the loop current is falling below $3,6 \mathrm{~mA}$ or the value exceeds $22,0 \mathrm{~mA}$, the potential free switch K1 is opening immediately. The switch K2 operates in the same way as K1 but with a turn-off delay of 10 sec . Those values are set ex work and can be changed by the USB2 adapter in connection with the KALIB-Software.

| Input: |  |  |
| :--- | :--- | :--- |
| I: Ioad-independent DC current: | $0(4) \ldots 20 \mathrm{~mA}$ <br> terminal $3-, 4+$ | input resistance approx. $100 \Omega$ |

## FEATURES

- Input:

2-wire initiator (Namur)/ potential
free contact, opto reflection
light barrier, 24 V NPN-signal,
$0,01 \mathrm{~Hz} . . .10 \mathrm{kHz}$
■ Output I/U - free scalable: current 0... 20 mA or voltage 0... 10
■ Contact Output:
frequency divider/multiplier
■ Parameterization and handling by push-button or PC interface
■ Display of actual value via LCD
■ Galvanic 3-way-isolation of 4 kV

## FUNCTION

The DFA 1-series is converting input signals of frequency sensors into standard current and voltage signals, e.g. at flow rate measurment, logging of rotation speed, monitoring of motors etc.
The parameterization is carried out by front side push-buttons and LCD display or via the integrated USB2/ USB-Simulator Interface in connection with the KALIB-Software

For monitoring reasons the actual state of the current in- and outputs can be displayed on the display. Every sensor input/ frequency output/ limit can be freely evaluated.
The two inputs can be added or subtracted.
Further details to be found at:
ORDERING INFORMATION.

\section*{FEATURES}
- 2 inputs:

2-wire initiator (Namur) or potential free contact or reflecting light barrier or reflecting light barrier with amplifier
■ Self-optimizing switching threshold
■ Output, simultaneously: current 0(4)... 20 mA and/ or voltage 0(2)... 10 V and a switching output as a frequency divider (e.g. \(\mathrm{m}^{3} /\) pulse)

■ Frequency conversion 0,1 Hz... 100 Hz
- Galvanic 3-way isolation

\section*{FUNCTION}

The range of applications includes primarily the transmission of instantaneous values and forms the basis for the display and/ or registration of the flow in pipelines.
The current output also serves for regulation and monitoring tasks.

The microprocessor controlled frequency analog transducer converts the pulses from the donors of the water meter (main and secondary meter) in a direct current (digital to analog converter). The current here is proportional to the instantaneous flow.
At two donors, the pulses are added.
Furthermore, the device is used to scale high resolution pulses in decadal pulses (e.g. \(\mathrm{m}^{3}\) ).
The programming of the transducer DFA 2.00 GW is performed by the three push buttons on the front panel.

\section*{FEATURES}
- Input:

2-wire initiator (Namur) or potential free contact
optional: second input for addition/ subtraction
■ Output:
Current (0)4... 20 mA and/ or
Voltage 0(2)... 10 V
optional:
Switching outputs with integrated frequency divider or limit switch
■ Pulse conversion 0,01 Hz... 10 kHz
- Parameterization, handling and actual value indication by display
■ Galvanic 3-way isolation of 4 kV

\section*{FUNCTION}

The DFA8 is converting an input signal generated by various frequency sensors into a standard current and voltage signal.
He is used for the flow rate measurement, logging of rotation speed, monitoring of motors etc.
The parameterization is made by the 2 front side push-buttons and indicated by display.
The 4-digit actual value display is free scalable. The actual flow through volume, the minimal or maximum measuring value of the past 60 minutes or 24 hours can be displayed.

The DFA 8.30 TW has 2 switching outputs, used as frequency divider or limit switch.
A second input which can be used as an adder or subtractor is available with the DFA 8.40 TW additional to the 2 switching outputs.

\section*{FEATURES}

■ 2 Inputs:
2-wire initiator (Namur) or potential free contact or optocoupler or reflecting light barrier or NPN/ PNP input
■ 2 transistor outputs: \(230 \mathrm{~V}, 100 \mathrm{~mA}\)
■ Impulse summator
- Signal multiplier

■ Pulse storage per channel
- Pulse duration adjustable

■ Galvanic 3-way isolation of \(1,5 \mathrm{kV}\)

\section*{FUNCTION}

The 2-channel Switching Amplifier enables the preparation of digital pulses. The preparation of pulses is used for various applications, e.g. determination of quantities, piece and event counting, supply of a sensor and processing for digital PLC-inputs.

The input signals are processed both with inductive or capacitive proximity switches and optoelectronic sensors. The following input signals can be processed: two-wire initiator according to EN 50227 (former DIN 19234) for NAMUR-sensors, reflecting light barriers, potential free contacts and sensors with transistor output.

The SI 5.20 GW can be compared with a pulse converter which prolongs the input pulses and prepares the signals. In function as an impulse summator the input pulses can be produced at the same time or temporally overlapping. The built-in microprocessor is able to store up to 100 input signals; thus, a protected feeding of the prepared signals is guaranteed. The inputs and outputs are galvanically isolated between each other and the auxiliary power.

\section*{FUNCTION}

The Frequency Divider IV 7.00 MW is being used for binary signal transmission out of control circuits into signal circuits.
The activation has to be carried out by a 2-wire proximity switch according to EN 50227 (NAMUR) or potential-free contacts. A reflecting light barrier or a 24 V DC signal/ tacho generator can also be used for this.
A division and a multiplication factor can be set by KALIB-Software. These values are also used to calculate ratios, e.g. 2/ 3.
Additional functions such as wipe time, starting characteristics, input filter, pulse memory and limits for short circuit or wire break detection can be set.

The simultaneous outputs can be parameterized separately and also be used as an alarm contact for wire break or short circuit.
The IV 7.00 MW has a solid state relay output (bipolar) and a relay output (1 changer). At higher frequencies the relay can be deactivated via KALIBSoftware.

\section*{FEATURES}

\section*{■ Simultation of}
- Current: 0... 20 mA
active or passive
- Voltage: 0... 10 V
- Metering
- Current -20...0...+20 mA
- Voltage -10...0...+10 V

■ USB2 Interface function: interface for parameterizable Schuhmann products
- Galvanic 3-way isolation of 500 V
■ Including USB-connecting lines, case and measuring lines

\section*{FUNCTION}

The universal measurement- and test equipment USB-Simulator is designed for the technician on site who has to simulate and meter current and voltage.
The unit is being operated via the usb port of a PC or notebook.
The operation is carried out by the KALIB-Software.
Caution: KALIB-Software and the USB-Driver have to be installed before the adapter will be connected to the PC.
To avoid damage to the simulator, first select function, then connect the measuring lines.

The range of application is divided as follows:

\section*{- Current or voltage transmitter:}

For the calibration and testing of loops and transducers.

\section*{- Voltmeter and amperemeter:}

With a resolution of \(0,1 \mathrm{~V}\) respectively \(0,1 \mathrm{~mA}\), measurements can be made directly on measuring loops or devices to be checked.
- USB2 Interface functionality:

The USB-Simulator can be used instead of the USB2 Interface for all parameterizable Schuhmann products.

\section*{Ordering information:}

\section*{Type:}

\section*{USB-Simulator}
incl. USB connecting cables, case, measuring lines

\section*{FEATURES}
- Simultation of:
- Current: 0... 22 mA
- Voltage: \(0 . . .11 \mathrm{~V}\)
- 2-wire transmitter 4... 20 mA
- Potentiometer up to approx. \(1000 \Omega\)
- Metering:
- Current 0... 100 mA
- Voltage 0... 50 V
- 2-wire transmitter 4... 20 mA

■ Incl. mains adapter, accumulator and measuring lines

\section*{FUNCTION}

The universal hand-held Simulator is made for technicians to measure and simulate currents, voltages and resistances on-site.

The device has a replaceable fuse to prevent overcurrent damage.

Caution: To avoid damage to the simulator, first select function, then connect the measuring lines.

The range of application is divided as follows:

\section*{- Current or voltage transmitter:}

For the calibration and testing of loops and transducers.

\section*{- Voltmeter and amperemeter:}

With a resolution of \(0,1 \mathrm{~V}\) respectively \(0,1 \mathrm{~mA}\), measurements can be made directly on measuring loops or devices to be checked.

\section*{- 2-wire simulator (4... 20 mA ):}

The Simulator can be used instead of a 2-wire transmitter, in order to control or adjust the measuring circuit.
- Testing of 2-wire transmitter:

The device generates a voltage of approx. 13 V , current limiting can be adjusted by a potentiometer, the current output ( \(4 \ldots 20 \mathrm{~mA}\) ) appears on the LCD-display.

\section*{- Simulation of a potentiometer transmitter:}

The internal 10-step potentiometer is switched on the sockets and the device can be used as an potentiometer up to approx. \(1000 \Omega\).

\section*{000}

\section*{Function:}

All output values are being adjusted by the 10-step potentiometer P1.

\end{tabular}

The unit is equipped with an replaceable safety fuse ( 200 mA ) to avoid damage during current measuring.
The included mains adapter is used to charge the accu as well as for possible supply via grid energy. If the accu is almost discharged, the display shows "BAT". The charging is being indicated by integrated LED at the side. Charging time for the accumulator is approx. 15 hours (Simulator switched off). The integrated current and voltage limitation prevents accu from overloading.

\section*{Type: \\ Simulator \\ incl. mains adapter, accumulator measuring lines}

\section*{FEATURES}

■ Outputs simultaneous: Current 0(4)... 20 mA active or passive (loop-powered)
Voltage 0(2)... 10 V
■ Front side operation, digitally adjustable 0...100,0 \% or alternatively controlled via external signals (24 V DC/ contact)
- Parameterization without auxiliary power via PC-interface
■ Galvanic 2-way isolation of 4 kV between auxiliary power

\section*{FUNCTION}

The devices of the SE 30 series serve as a setpoint adjuster.
A simultaneously current- (active and passive) or voltage output signal is available.
The adjustment respectively a change of the setpoint at the output is carried out by front pushbuttons or with the USB2 interface/ USB-Simulator in connection with the KALIB-Software.
Alternatively, external control inputs for changing the specification of the setpoint can be used. This allows, for example, the control of the SE 30 series by a PLC.

SE 30.00 GW: potential-free contacts SE 30.24 GW: 24 V DC control pulse inputs
With the KALIB-Software, all parameters and in addition, the functions of external signals (saw tooth/ limit) are adjustable.
The digital adjustment is carried out in steps starting with \(0,1 \%\). So the selection of the actuator and actuating element to the required output values is easy.
The 4-digit setpoint display is free scalable.
Factory setting:
\(0,0 \ldots 100,0 \%\) display \(\triangleq 4 . . .20 \mathrm{~mA}\) output.

\end{aligned}
\] \\
\hline
\end{tabular}

The maximum limits for current- and voltage output are fixed at 21 mA respectively \(10,5 \mathrm{~V}\).

\section*{Adjustment:}

Output value is adjustable with the push-buttons:

The parameterization can be carried out for commissioning alternatively via the KALIB-Software. For this you need a PC and the interface adapter USB2/ USB-Simulator with KALIB-Software. It can be set the same parameters as also on display and in addition, the functions of external signals (saw tooth/ limit) are adjustable.
Examples of parameterization (see page 05-06):
out. \(\mathrm{A}=20[\%](\hat{=} 4 \mathrm{~mA})\) out. \(\mathrm{E}=100[\%](\hat{}(20 \mathrm{~mA}) \quad\) dis. \(\mathrm{A}=4,0 \quad\) dis. \(\mathrm{E}=20,0\)
Display \(4,0 \xlongequal{\wedge} 4,0 \mathrm{~mA}\) at output
Display 20,0 \(\xlongequal[=]{20,0} \mathrm{~mA}\) at output, adjustable in 0,1 steps
out. \(\mathrm{A}=0[\%](\hat{=} 0 \mathrm{~mA}) \quad\) out. \(\mathrm{E}=50[\%](\hat{=} 10 \mathrm{~mA}) \quad\) dis. \(\mathrm{A}=-10,00 \quad\) dis. \(\mathrm{E}=60,00\)
Display \(-10,00 \xlongequal{\wedge} 0,00 \mathrm{~mA}\) at output
Display \(60,00 \xlongequal{\wedge} 10,00 \mathrm{~mA}\) at output, adjustable in 0,01 steps
\[
\text { Factory setting: } \quad 0,1 \% \text { step size; } 0,0 \ldots 100,0 \% \text { Display } \xlongequal[=]{ } 4,0 \ldots 20,0 \mathrm{~mA} \text { at output }
\]

\section*{Environmental conditions:}

\section*{FEATURES}
- Calculating functions:

\section*{\(\oplus \underbrace{\bullet} \odot\)}
- Minimum-/ Maximum selector
- Linearization
- Freely configurable:

3 inputs \(\pm 20 \mathrm{~mA}\)
1 output 0 (4)... \(20 \mathrm{~mA} / 0(2) . . .10 \mathrm{~V}\)
■ Parameterization without auxiliary power via PC-interface

■ Galvanic 3-way isolation of \(2,5 \mathrm{kV}\)
Low internal consumption

\section*{FUNCTION}

The Analog Calculator is used for calculations such as addition, subtraction and linearization of analog values which as a result have an analog signal in kind of a current or a voltage. Due to its customized setting of all individual input signals, the mode of calculation and the output signal the device has a large range of application. It is equipped with bipolar current inputs as well as a current and voltage output.

The AS 3.00 SDC is being parameterized by the USB2 adapter in connection with KALIB-Software. The basic calculation units can be selected directly, linearizations are produced by a table of values and a polynomial calculation with optimization. Actual measured values of input and output can also be visualized.

\section*{FUNCTION}

Amplifiers are used for the galvanic isolation or conversion of analog signals. This guarantees a safe decoupling between sensor and evaluation circuit and any influence of other sensor circuits among each other is absolutely impossible. Due to its individual setting of input and output signals the device has a large range of application. It is equipped with one bipolar current input as well as a current or voltage output. It is being parameterized by the USB2 Interface in connection with KALIB-Software.

The AWS 1.00 SDC memorizes direct current signals which are available for a short time only. The external activation to memorize a defined time value can be carried out by a contact or a potential free transistor output. Typical applications are amongst other things e.g. memorizing of desired value in discontinuous processes, storage of signals in case of disturbances of previous instruments, by cyclic requests of inputs via multiplexer or to hold a transmitter signal for the purpose of repairing the readings recorder.

}

Year
Warranty

\section*{FEATURES}

■ Input, switchable:
AC current up to 600 A AC,
True RMS value recording
■ Output, simultaneous: Current 0(4)... 20 mA and
Voltage 0(2)... 10 V
1 relay as limit-switch
■ Clip-on sensor specification
60 A/ 100 A/ 200 A/ 400 A/ 600 A AC
■ Parameterization via PC-interface
■ Galvanic 3-way isolation of 4 kV

\section*{FUNCTION}

The UW 13.00 GW and the clip-on sensor included in delivery is one unit.
The recording of true RMS measuring, online actual values, operating conditions of small and large pumps, motors etc. is very simple to realise with the clip-on sensor.
The clip-on sensor is recording AC current signals in a range from 1 A up to 60 AAC and is also available for larger currents such as \(100 \mathrm{~A}, 200 \mathrm{~A}, 400 \mathrm{~A}\) and 600 A .

The measuring range can be selected by turn-switch on front side. Signal attenuation, relay switchingpoint, hysteresis, switching-delay and the output signal are adjustable by the USB2 Interface in connection with the KALIB-Software.
Relay status is being indicated by LED on front side. By new installation, modernization, retrofitting or extension of a plant the mounting of the sensor is easy due to the clip-on system of it and even possible during operation.

Connection diagram:

Schuhmann GmbH \& Co. KG
Römerstraße 2
D-74363 Güglingen
Tel. +4971355056
E-mail: info@schuhmann-messtechnik.de www.schuhmann-messtechnik.de

\section*{Input:}

Only connect the included clip-on sensor at the input!
Connection: terminal 9 (k), 10 (i)
It is recommended to perform a screened signal cable between sensor and current transformer!
- AC current \(50 / 60 \mathrm{~Hz}\), up to 600 A AC (depending on clip-on sensor)
- True RMS value recording

\section*{Clip-on sensor:}
- easy mounting on wire - insulating resistance min. \(50 \mathrm{M} \Omega\)
- screwed connection - test voltage 2,2 kV eff. 1 min.
- output with excess voltage protective diode
available range:
\begin{tabular}{|c|c|c|c|c|}
\hline Sensor & Rated current & max. current & max. cable- \(\varnothing\) & Dimension \\
\hline 60 A & 60 A AC & 100 A AC & 10 mm & \(26 \times 23 \times 48 \mathrm{~mm}\) \\

\section*{FEATURES}

■ 1 input for AC current:
1 A AC, \(50 / 60 \mathrm{~Hz}\) or
5 A AC, \(50 / 60 \mathrm{~Hz}\)
- Outputs simultaneous: Voltage \(0(2) . . .10 \mathrm{~V}\) and Current 0(4)... 20 mA active or loop-powered

■ Function, switchable:
- fixed calibration or
- adjustable by trimmer or
- simulation mode for outputs

■ Galvanic 3-way isolation of \(2,5 \mathrm{kV}\)
Low internal consumption

\section*{FUNCTION}

Amplifiers are used for the galvanic isolation or conversion of analog signals. This guarantees a safe decoupling between sensor and evaluation circuit and any influence of other sensor circuit among each other is absolutely impossible. This Amplifier is equipped with one standard AC current input ( 1 A AC or 5 A AC ) as well as current and voltage outputs.

The TF 39.00 GW can be switched to different characteristics of transmission by front side turnswitch. Fixed calibrated measuring ranges for input and output are stored in switch setting \(0 . . .7\). In position 8 ...D the transmission ranges can be adjusted by zero point and range trimmer. A damping of 3 seconds is selectable in addition. Position E and F are used for simulation during initial operation, here a fixed output value can be generated by zero point and range trimmer, without input signal.

\section*{FEATURES}

\section*{■ Input:}

PT 100, NI 1000, PTC, KTY, thermocouples, poti \(0 . . .5 \mathrm{k} \Omega\), other sensors via software

■ Output: 0(4)... \(20 \mathrm{~mA} / 0(2) . . .10 \mathrm{~V}\)
■ 2 relays, function selectable
- Detection of sensor break and short-circuit
- Redundant measurement at thermocouples possible
■ Int./ ext. cold-junction compensation
■ Parameterization without auxiliary power via PC-interface
- Galvanic 3-way isolation of 4 kV

\section*{FUNCTION}

The MU 1.00 GW is processing sensor signals and is used for the precise measurement of virtually all temperature sensors. Measurements of temperatures within a range of -200 and \(+2400{ }^{\circ} \mathrm{C}\) can be made, for example in air-conditioning and process engineering. Sensor break and sensor short-circuit are signalized and can be used as safety functions. By PT-sensors different connections can be selected: 2-, 3-, 4-wire system. The measuring line of the 3or 4-wire connection is detected on wire break or short-circuits.

Further temperature sensor cams can be produced by a table of value and assigned to the transducer by the USB2 Interface in connection with KALIBSoftware. Higher functional safety offers the redundant connection of thermocouples to the transducer. Indication of status is signalized by a front sided LED. The integrated protective switching with suppressor diode protects the secondary circuit from voltage peaks and transient excess voltage.
2 relays for error evaluation, limit value monitoring and tendency function are available. Switching status of the relays are signalized by LEDs on front side.

\section*{Mounting details:}

Housing for top hat rail
Type of protection: IP 40 housing IP 20 clamps
Mounting rail fixed according to
EN 50022-35 x 6,2 mm
Width:
\(22,5 \mathrm{~mm}\)
Weight: \(\quad 180 \mathrm{~g}\)
Material: Polyamide PA
Flammability class: Vo (UL 94)
Approval:
Connection:
plugg. screw clamps \(\leq 2,5 \mathrm{~mm}^{2}\)
Please check parameterization before initial operation!

\section*{Ordering information:}

Type: MU 1.00 GW wide range
Accessories: USB2/ USB-Simulator with KALIB-Software

\section*{FEATURES}

\section*{■ Input:}

PT 100, PT 500, PT 1000, NI 500, NI 1000, PTC, KTY, thermocouples e.g. type J, K, L, N, S, Poti \(0 . . .5\) k \(\Omega\), other Sensors via Software

■ Output: 0(4)... \(20 \mathrm{~mA} / 0(2) . .10 \mathrm{~V}\)
- Detection of sensor break and short-circuit
- Redundant measurement at thermocouples possible
■ Int./ext. cold-junction compensation
- Parameterization without auxiliary power via PC-interface

■ Galvanic 3-way isolation of 2,5 kV

\section*{FUNCTION}

The MU 1.00 S is processing sensor signals and is used for the precise measurement of virtually all temperature sensors. Measurements of temperatures within a range of -200 and \(+2400^{\circ} \mathrm{C}\) can be made, for example in air-conditioning and process engineering. Sensor break and sensor short-circuit are signalized and can be used as safety functions. By PT-sensors different connections can be selected: 2-, 3-, 4-wire system. The measuring line of the 3or 4 -wire connection is detected on wire break or short-circuits.

Further temperature sensor cams can be produced by a table of value and assigned to the transducer by the USB2 Interface in connection with KALIBSoftware. Higher functional safety offers the redundant connection of thermocouples to the transducer. Indication of status is signalized by front sided LED. The integrated protective switching with suppressor diode protects the secondary circuit from voltage peaks and transient excess voltage.

\section*{FEATURES}

■ Input, switchable: PT 100, PT 500, PT 1000, Ni 1000, resistor up to \(5 \mathrm{k} \Omega\) in 2-, 3- or 4-wire technology
■ Output, simultaneous: Current 0(4)... 20 mA (active or passive) and Voltage 0(2)... 10 V
- Potential-free relay output for the detection of sensor errors
- Range, limit and offset setting options
■ Galvanic 4-way isolation

\section*{FUNCTION}

The MPU 1.00 GW is processing PT 100, PT 500, PT 1000 and Ni 1000 signals as well as resistors up to \(5 \mathrm{k} \Omega\).
It is used for the precise measurement of temperature with resistance thermometers in 2-, 3- or 4-wire technology.
Its outputs can do current (active or passive) and voltage simultaneous.
Additionally adjustable are minimum and maximum limits for the output signal.
A potential-free relay is available for the monitoring of sensor errors, which can be operated inverted or non-inverted.

The selection of the values, the operation/setting/ parameterization for

Input:
- measuring and temperature range
- 2-, 3-, 4-wire
- zero point correction for 2-wire measurement Output:
- minimum and maximum limits
- relay (inverted or non-inverted)
is made either with the front panel push-buttons with inclusion of the display, or with the USB2 interface adapter resp. USB-Simulator in connection with the KALIB-Software.

parameterizing
mode

e．g．2．drA：
The two－wire technique is used as the measuring method．
e．g．+10.0 ：
Shifting of the measuring zero point by the set value．
e．g．20：
Measurement initial value is \(20^{\circ} \mathrm{C}\) ．
e．g．100：
Measurement end value is \(100^{\circ} \mathrm{C}\) ．

Presetting of all important parameters．

Selection of the right tem－ perature sensor basically for the calculation of the current temperature．

In three or four－wire operation，the line resistance can be auto－ matically calculated and corrected．

The measuring zero point can be shifted for example in the two－wire technique for correction of the line resistances．

When the adjusted temperature is measured， the analogue output is set to the value which is adjusted under＂initial／ end value output signal＂．

For safety reasons we recommend to mount the housing for top hat rail with a distance of approx. 5 mm to each other. Please check switch position before initial operation!

\section*{FEATURES}

■ 1 Input, switchable: for 2-wire resistance transmitter
\(0 . . .2 \mathrm{k} \Omega / 0 . . .10 \mathrm{k} \Omega / 0 . . .20 \mathrm{k} \Omega /\)
\(0 . . .100 \mathrm{k} \Omega\)
- Output, simultaneous: Current 0(4)... 20 mA and
Voltage 0(2)... 10 V
- Fine-adjustment of offset and gain by trimmer

■ Galvanic 3-way isolation

On the input side there are the calibrated special measuring ranges \(0 \ldots 2 \mathrm{k} \Omega / 0 \ldots 10 \mathrm{k} \Omega / 0 \ldots 20 \mathrm{k} \Omega\) and \(0 . .100 \mathrm{k} \Omega\) available. These can be chosen from the table on the side and switched by turn-switch on front side.
The device is equipped with a simultaneous output for current and voltage.

\section*{FUNCTION}

The WU 39.04 GW converts the value of resistance input into a linear current and voltage signal and is used for e.g. analysis of position meters, filling-level meters etc. The line resistance can be compensated by a zero and range trimmer.
At the input a potentiometer or a resistance transmitter in 2-wire technique can be connected.

\section*{FEATURES}

■ Galvanic isolation of 3 kV between PC and connected device

■ USB 2.0 B
- No additional auxiliary power required

■ Status indication via 3 LEDs
■ with driver and KALIB-Software, suitable for
Windows 8, 8.1, 10

\section*{FUNCTION}

To set up the parameterizable Schuhmann devices* the USB2 interface in connection with the KALIBSoftware is required. The current overview of these devices is available on our homepage.
The adapter serves as an interface between the PC and the connected device. The TTL signal of the Schuhmann device will be digitally prepared and then transferred by an optical coupler to the PC. With the KALIB-Software the following parameter can be defined: input, measuring start, measuring end, attenuation, failure limit etc. The settings can be saved in a file and easily transferred to further units.

Due to the galvanic isolation between device and computer potential delays as well as short-circuits of the normally earthed PC will be avoided.
Most of the devices to be programmed* are supplied with power via the USB2 interface.

Caution: KALIB-Software and the USB-Driver have to be installed before the adapter will be connected to the PC.

\section*{Input:}
USB2 interface for the connection with the PC.
Directly fed by PC:
\begin{tabular}{ll} 
auxiliary power: & \(5 \mathrm{~V} D C\) \\
current consumption: & max. 60 mA \\
protocol: & USB 2.0 B
\end{tabular}

\section*{Output:}

TTL- respectively USB interface for the connection with the PC:
\[
\begin{array}{ll}
\text { connections: } & \begin{array}{l}
3,5 \mathrm{~mm} \text { jack plug } \\
\text { mini-USB }
\end{array}
\end{array}
\]

Display:
\begin{tabular}{lll} 
LED RDY: & green, active & USB communication with the PC in order (driver loaded) \\
LED TXD: & red, active & data sent from PC to the device \\
LED RXD & red, active & PC receives data from the device
\end{tabular}

\section*{Included in delivery:}

Tel. +4971355056
E-mail: info@schuhmann-messtechnik.de www.schuhmann-messtechnik.de

\section*{FEATURES}

■ 2 Inputs:
PT 100, 3-wire
■ 2 Outputs: transistor output 24 V to 5 kHz
■ Indication of operation condition by 2 color LED per channel

■ Parameterization via PC-interface
- Galvanic 2-way isolation of 4 kV

\section*{FUNCTION}

The Temperature Frequency Converter is used to convert a PT 100 value of resistance into a frequency. Both 3 -wire inputs the PT 100 value of resistance get collected and digitised. The measured values will be linearised and scaled according to the settings. This value is being converted into a continuous frequency which can subsequent processed as a 24 V signal at the output by a optocoupler.

With the USB2 Interface in connection with KALIBSoftware a frequency range between 0 ... 5000 Hz for \(-50^{\circ} \mathrm{C}\) (zero point) plus \(500^{\circ} \mathrm{C}\) (terminal value) can be selected.
The frequency for sensor break/ short-circuit is adjustable.
The AF 29.01 GDC has 2 transistor outputs whose indication of operation is displayed by 2 LEDs on front side.

\section*{AF 29.01 GDC}

\section*{FEATURES}

■ 4 inputs:
current \(\pm 70 \mathrm{~mA}\) or
voltage \(\pm 12 \mathrm{~V}\)
- 1 output

■ Switch by 2 control signals
■ Galvanic 2-way isolation of \(2,5 \mathrm{kV}\)

The output is galvanically connected with the input. Auxiliary power/ channel selection are galvanically isolated across from the input/ output.

\section*{FUNCTION}

The multiplexer MUX 25.00 MDC provides the expandability of the analog inputs at a PLC.
It has 4 inputs which can process analog signals like currents and voltages.
Because of the channel selection by two address lines (e.g. 2 digital PLC outputs) is one of the 4 inputs connected trough to the output.
\[
\text { Auxiliary power: 20... } 30 \text { V DC }

V0 (UL94)
CE
pluggable
screw clamps
0,2...2,5 mm²
For safety reasons we recommend to mount the housing for top hat rail with a distance of approx. 5 mm to each other.

Type: MUX 25.00 MDC \(24 V D C\)

\author{
FEATURES \\ ■ Output: \\ Current max. 22 mA \\ Voltage max. 26 V \\ ■ Intergrated current and voltage limitation \\ ■ Supply of 2-, 3- and 4-wire transducers \\ ■ Pluggable screw-clamps \\ ■ Galvanic 2-way isolation
}

The feeding device consists of a built-in current source with integrated limiting which provides auxiliary power for the transducer to be connected

There is a limit to the no-load voltage at 26 V DC. In order to make the respective input short-circuit proof, the electronically limited current source is limiting its output signal - according to type of device - at 22 mA .

The limitation of open-circuit voltage takes place at 26 V DC

\section*{FEATURES}

■ 6-digit 7 segment LED display with 2 additional status LED's

■ Display red or green
- Communication via Profibus-DP 9,6 kBaud... 12 MBaud

■ Slave-address adjustable on reverse
■ Galvanic 3-way isolation

\section*{FUNCTION}

The BP-AZ 31UC is suited for the direct connection to a Profibus-DP network which can be applied in plant engineering and construction as well as mechanical engineering. With the Profibus Interface a simple and cost saving connection to a modern guidance system is possible.
Due to the flexible representation of measuring values the application range includes: power stations, engines, food industry, large-scale installations, water treatment and chemical industry.

The 6-digit process indicator is communicated directly by the Profibus-DP. The values to be indicated will be transmitted via BCD-code. The indicated value ranges from -999999... 999999 with any decimal place. Additionally 2 red status LED's are installed on the front side, sign and comma position will be transmitted by a Byte. On the reverse you can find LED's for diagnostics of the Profibus-DP communication, auxiliary power and 9-pole Profibus connection.
